Amazon AWS-Certified-Security-Specialty-SCS-C01 (AWS Certified Security - Specialty (SCS-C01))

Question 10 of 15

A DevOps team is currently looking at the security aspect of their CI/CD pipeline. They are making use of AWS resource? for their infrastructure. They want to ensure that the EC2 instances don't have any high security vulnerabilities. They want to ensure a complete DevSecOps process. How can this be achieved?

Please select:

- A. Use AWS Config to check the state of the EC2 instance for any sort of security issues.
- B. Use AWS Inspector APIs in the pipeline for the EC2 instances
- C. Use AWS Trusted Advisor APIs in the pipeline for the EC2 instances
- D. Use AWS Security Groups to ensure no vulnerabilities are present

Answer: B

Explanation:

Amazon Inspector offers a programmatic way to find security defects or misconfigurations in your operating systems and applications. Because you can use API calls to access both the processing of assessments and the results of your assessments, integration of the findings into workflow and notification systems is simple.

DevOps teams can integrate Amazon Inspector into their CI/CD pipelines and use it to identify any pre-existing issues or when new issues are introduced.

Option A C and D are all incorrect since these services cannot check for Security Vulnerabilities. These can only be checked by the AWS Inspector service.

What is AWS? Amazon Web Service

Amazon Web Services (AWS) is a secure cloud services platform, offering compute power, database storage, content delivery and other functionality to help businesses scale and grow. Explore how millions of customers are currently leveraging AWS cloud products and solutions to build sophisticated applications with increased flexibility, scalability and reliability.

Amazon AWS-Certified-Advanced-Networking-Specialty-ANS-C09 (AWS Certified Advanced Networking - Specialty (ANS-C09))

Question 2 of 15

Your on-premises network has an IP address range of 11.11.0.0/16. Only IPs within this network range can be used for inter-server communication. The IP address range 11.11.253.0/24 has been allocated for the cloud.

You need to design a VPC in AWS. The servers within the VPC should be able to communicate with hosts both on the Internet and on-premises through a VPN connection. What combination of configuration steps meets your needs? (Choose two)

- A. Set up the VPC with an IP address range of 11.11.253.0/24.
- B. Set up the VPC with an RFC 1918 private IP address range (e.g., 10.10.10.0/24), and set up a NAT gateway to do translation between 10.10.10.0/24 and 11.11.253.0/24 for all outbound traffic.
- C. Set up a VPN connection between a VGW and an on-premises router; set the VGW as the default gateway for all traffic, and configure the on-premises router to forward traffic to the Internet.
- D. Set up a VPN connection between a VGW and an on-premises router; set the VGW as the default gateway for traffic destined to 11.11.0.0/24, and add a VPC subnet route to point the default gateway to an Internet gateway for Internet traffic.
- E. Set up the VPC with an RFC 1918 private IP address range (e.g., 10.10.10.0/24), and set the VGW to do a source IP translation of all outbound packets to 11.11.0.0/16.

Answer: A,C

Explanation:

The VPC needs to use a CIDR block in the assigned range (and be non-overlapping with the data center). All traffic not destined for the VPC is routed to the VGW (that route is assumed) and must then be forwarded to the Internet when it arrives on-premises. B and E are wrong because they are not in the assigned range (you can use non-RFC 1918 addresses in a VPC). D is wrong because it directs traffic to the Internet through the Internet gateway.

Question 8 of 20

A Solutions Architect is developing an AWS Lambda-based service for a global networking game to retrieve information on board landmarks stored in an Amazon DynamoDB table. The Solutions Architect wants to minimize costs as the service scales to many millions of users through a mobile app.

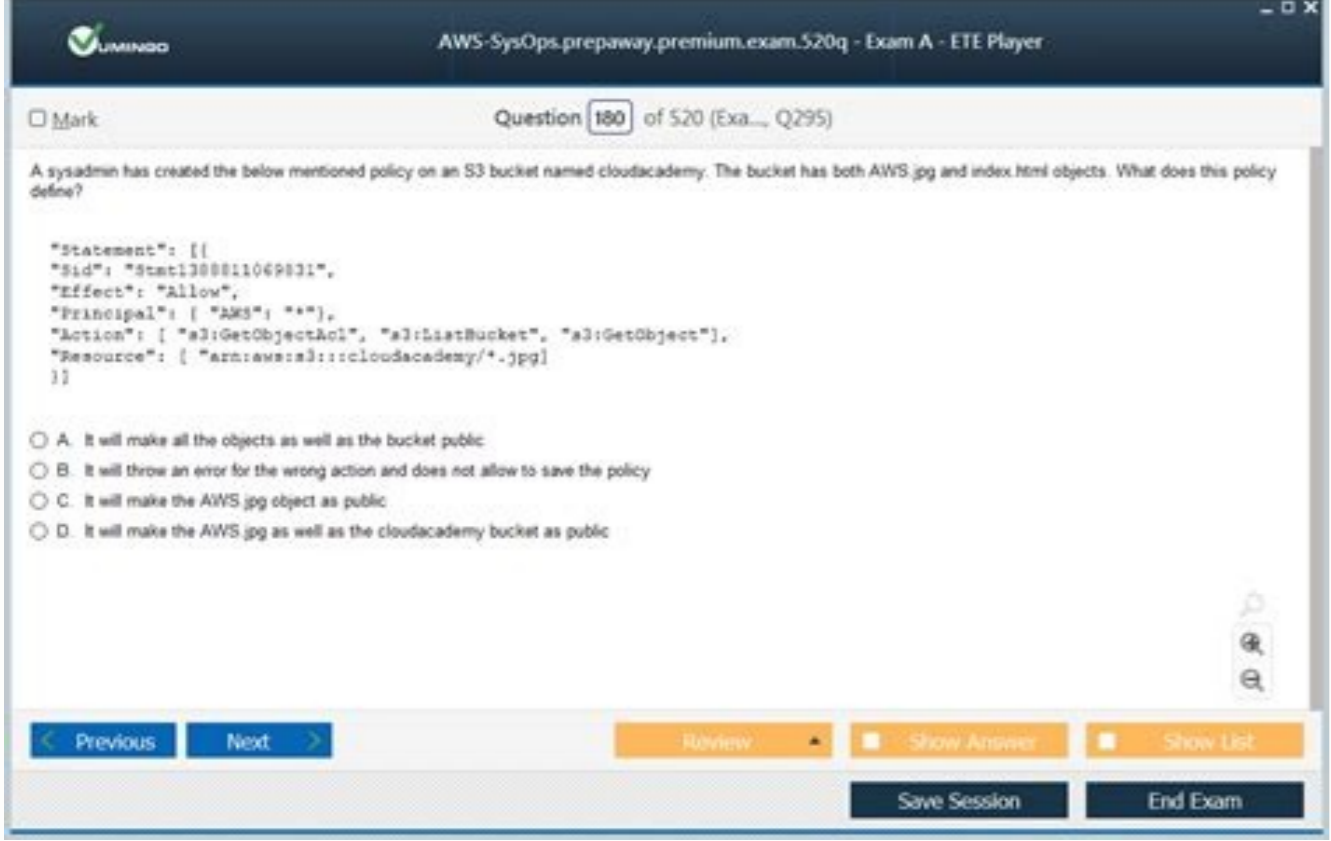

How can the Solutions Architect optimize performance while minimizing costs? (Select TWO)

- A. Use DynamoDB Accelerator (DAX), and configure Auto Scaling of read throughput on the DynamoDB table.
- B. Configure Amazon ElastiCache to cache responses on the mobile client and configure Auto Scaling of reads on the DynamoDB table.
- C. Configure Amazon CloudFront, specify an appropriate TTL for response caching, and configure the DynamoDB table as the origin.
- D. Authorize mobile clients to communicate directly with DynamoDB through AWS STS tokens, and configure DynamoDB for global replication and Auto Scaling.
- E. Expose the Lambda function through the Amazon API Gateway, configure the endpoint with caching, and configure Auto Scaling of read throughput on the DynamoDB table.
